Hiring Team
Brillion

Brillion's mission to empower energy providers in driving a clean energy future resonates with my experience leading product roadmaps and cross-functional teams to deliver customer-focused software solutions. At Chamberlain Group, I managed the MyQ Community platform roadmap, coordinating engineering, design, and customer success to improve feature prioritization and sprint execution. This hands-on experience with Agile processes and stakeholder alignment directly aligns with Brillion's need for a product manager who can own strategy, roadmap, and execution while thinking across the full portfolio.

I'm particularly drawn to the opportunity to work on SaaS products that help utilities transform customer relationships into true partnerships. My background in building AI-powered analytics and automation workflows at LITET has given me a practical understanding of how to leverage technology to simplify complex operational challenges and improve customer outcomes. While Brillion's focus is on clean energy and utilities, the principles of delivering measurable customer value through thoughtful product design and execution are universal.

I'm comfortable making high-judgment decisions and setting direction for meaningful business segments, having influenced roadmap strategy and led prioritization initiatives that balanced scalability with customer needs at Emerson Electric. Representing products to senior leadership and external stakeholders is also a familiar part of my work, ensuring alignment and clarity on product vision and outcomes.

Joining Brillion would allow me to apply my technical product management skills and systems thinking in a purpose-driven environment where software solutions directly support sustainability goals. I look forward to contributing to your team's efforts to create smarter program workflows and better customer experiences that help utilities meet their clean energy objectives.

Sincerely,
Ricardo Lugo
