Hiring Team

Euclid

Euclid's mission to accelerate renewable energy deployment resonates with my experience building AI-powered tools that simplify complex workflows and drive measurable business impact. At LITET, I developed AI-driven analytics agents that automated reporting and decision-making processes, reducing manual effort by 80% and enabling daily operational insights. This hands-on work with AI to automate workflows aligns closely with your need for a Senior Product Manager who can build AI-powered tools to streamline renewable energy project workflows.

I'm drawn to the opportunity to work directly with customers and cross-functional teams to identify pain points and translate them into pragmatic features. My background includes collaborating with engineering, design, and leadership to shape product roadmaps and prioritize features that maximize customer value, as I did managing roadmap strategy and stakeholder alignment at Emerson Electric and Chamberlain Group. I'm comfortable navigating ambiguity and structuring simple solutions from complex problems, which I see as essential for driving Euclid's platform intelligence forward.

Becoming a renewable energy expert and trusted advisor at Euclid excites me because it combines my passion for impactful technology with a mission that matters. I appreciate your focus on user research, experimentation, and building best practices into workflows—areas where I have consistently contributed by developing KPI dashboards and analytics systems that support data-driven decision-making and growth.

Euclid's commitment to meaningful work, bold thinking, and a collaborative culture fits well with how I approach product management: with curiosity, empathy, and a focus on delivering real value. I look forward to the chance to contribute to your platform's evolution and help accelerate the world's transition to clean energy.

Sincerely,
Ricardo Lugo
